

# S & J Taylor Forest Project

ACR  
783

STANDARD

American  
Carbon  
Registry

METHOD

IFM 2.0

LOCATION

South Central  
Arkansas

18K  
ACRES  
CONSERVED

## A Lush, Vibrant Habitat

The S&J Taylor Forest Carbon Project balances conservation of both Saline River bottoms riparian hardwoods and “working” pines in the heart of timber country. Diverse oak, gum, cypress, hickory, and pine forests located in south central Arkansas within the Gulf Coastal Plain eco-region represent important habitat and provide essential buffers that abate sedimentation and nutrient runoff between development and waterways. By committing to maintain forest CO<sub>2</sub>e stocks through certified sustainable management, the project will provide significant climate benefits through carbon sequestration and important co-benefits to the Ouachita watershed, local communities, and improved water resources to downstream neighbors throughout the Gulf Coastal Plain Region.

1.5M  
CREDITS

In the S&J Taylor Forest Carbon Project, large tracts of riparian bottomland hardwoods surround the pristine waters of the Upper Saline River and are essential buffers from runoff to the river and to the habitat of the endemic freshwater Arkansas fatmucket mussels.

“Our family has managed these forests for generations. The NativState forest carbon program will empower the next generation to continue our legacy of stewardship, conservation, and sustainable forest management.”
